Ingredients**

DISHWASHING LIQUID

Shepros Sdn. Bhd.

What is Dishwashing Detergent?

Dishwashing detergents are an inevitable part of our kitchen hygiene. It is unavoidable whether the dishes are washed in a dishwasher or manually. We use detergents to clean our dishes, but are they really doing their job? Have we ever thought about the ingredients of these detergents? Are there any side effects by using them? Now, with increased awareness about the health hazards presented by house-hold articles, doubts are being raised about its toxicity.

When dishes are washed with detergents, some of them leave a residue on the surface of the dishes, which is consumed when it is used next time. Some of these detergents have strong disinfectants, which are harmful to the skin. Some others emit gases that cause allergies and respiratory problems.

The detergents we use to clean our dishes flow down the drain after its purported use. They undergo chemical treatment in sewage treatment plants, before being released into waterways. During this treatment, most of the toxic chemicals are neutralized and made harmless. But some of them still remain, causing environmental pollution.

To analyze the effects of detergents, we need to know more about the common ingredients of commercial dishwasher detergents in the market. Typical non-environment friendly conventional dishwashing detergent formulations generally contain several items in the list below.

- **Phosphates**

It dissolves calcium and magnesium ions to prevent 'hard-water' type lime scale deposits. They can cause ecological damage, so their use is starting to be phased out.

- **Bleaching agents**

Powders and liquids bleaching agents contain either oxygen or chlorine based bleaching agents. It breaks up and bleaches organic deposits.

- **Synthetic surfactants**

Lowers the surface tension of the water, emulsifies oil, lipid and fat food deposits. It also prevents droplet spotting on drying.

- **Alkaline salts**

These are a primary component, in older & original-style dishwasher detergent powders. Highly alkaline salts attack & dissolve grease, but are extremely corrosive (fatal) if swallowed. Salts used may include meta-silicates, alkali metal hydroxides and sodium carbonate.

- **Enzymes**

Breaks up and dissolves protein-based food deposits, and possibly oil, lipid and fat deposits. Proteases do this by breaking down the proteins into smaller peptides that are more easily washed away.

- **Anti-corrosion agent(s)**

Often sodium silicate, this prevents corrosion of dishwasher components.

- **Anti-foaming agents**

Reduce foam that interferes with the washing action.

- **Additives**

It is used to slow down the removal of glaze and patterns from glazed ceramics dishes.

- **Perfumes**

Petrochemical solvent base perfumes as fragrance.

- **Chemical Gelling agents**

Use as thickening agent in both liquid and gel based dishwashing detergent.

Environmental Concerns

Dishwashing detergents can have poisonous effects in all types of aquatic life if they are present in sufficient quantities, and this includes the biodegradable detergents. They are a lot of detergents which claim to be biodegradable; but it takes months to achieve the biodegradability.

Non biodegradable synthetic surfactant such as nonyl phenol (NPE) is a general group of synthetic surfactants in dishwashing detergent. This chemical biodegrades slowly and leaves trace amounts in the soil and water. Researchers have found that NPE in water can cause feminization of male fish. It is also thought to increase the risk of breast cancer as it mimics female hormone activity in mammals.

Slow degrading dishwashing detergents also have higher probability of destroying the external mucus layers and damage the gills which expose to the fish to bacteria and parasites attack. Besides that, it also kills fish eggs. Dishwashing detergents also create problem for aquatic life by lowering the surface tension of the water. Organic chemicals such as pesticides and phenols are then much more easily absorbed by the fish. It causes fish to absorb double the amount of chemicals they would normally absorb, although that concentration itself is not high enough to affect fish directly.

Phosphates in dishwashing detergents can lead to freshwater algal blooms that release toxins and deplete oxygen in waterways. The pollution of phosphates can generate algal blooms on the excess phosphorus and consumed most of the oxygen in the waters, killing fish and plants. Phosphates can also combine with other plant nutrients such as nitrogen and contribute to eutrophication. This results in excessive phytoplankton growth that kills off fish and other aquatic plant life.

Pollution and environmental problems from synthetic detergents

Ban on Phosphates Dishwashing Detergent

Canada

New Canadian federal regulations came into force on July 1, 2010 that will effectively ban phosphorus in household dishwashing detergents, laundry detergents, and other cleaning products. The new rules mirror regulations enacted by Manitoba in 2008 and Minnesota in 2005. Removing phosphorus from dishwasher detergents alone is estimated to reduce the phosphorus loads to lakes from human sources by about 10%. The new regulations will impose a phosphorus limit of 0.5% by weight for household cleaners, dish washing detergents (hand and automatic), and laundry detergents.

European Union

European Parliament's Environment Committee proposed to ban all but trace amounts of phosphates in household dishwasher detergents sold within the EU beginning in 2015. The parliamentary committee approved the dishwasher recommendation on 15th June 2011 as part of a wider proposal that also calls for restricting phosphates in household laundry detergents beginning in 2013. Specifically, the committee recommended that phosphorus compounds in detergents not exceed 0.5 gram per standard load.

Most western European nations, including the UK, France, Germany, Italy, Belgium and the Netherlands, have already either banned or restricted the use of phosphates in household laundry detergents. France will ban dishwasher detergent phosphates beginning in 2012, while Sweden and Finland are considering dishwasher bans.

United States of America

On 1st July 2010, 16 states banned the sale of dishwasher detergents that contain high levels of phosphates, a source of pollution in lakes and streams. Stores will not be allowed to sell detergent with more than 0.5 percent phosphorous. States instituting the rule include Illinois, Indiana, Maryland, Massachusetts, Michigan, Minnesota, Montana, New Hampshire, Ohio, Oregon, Pennsylvania, Utah, Vermont, Virginia, Washington and Wisconsin.

Dishwashing Detergent Contact Dermatitis

Contact dermatitis is characterized by inflammation of the skin due to external skin contact with an irritating substance such as dishwashing detergent. Contact dermatitis is divided into two types: irritant contact dermatitis and allergic contact dermatitis. If you experience mouth swelling, in addition to other allergy symptoms, when exposed to dishwashing detergent, you are likely experiencing allergic contact dermatitis.

Allergic contact dermatitis, which occurs in two phases, develops as a result of a hypersensitivity reaction elicited through your immune system. The first phase of allergic contact dermatitis is called the sensitization phase. During this phase, the allergen in dishwashing detergent penetrates the skin and attaches to specific immune cells, called Langerhan's cells, which carry the allergen to the lymph nodes. At this point, another type of immune cell, called T-lymphocytes, produce cells that develop a memory for the allergen. The sensitization phase occurs only once and generally does not produce any physical symptoms.

The next phase is called the elicitation phase. Next time you are exposed to the chemical in the dishwashing detergent, T-lymphocytes begin to multiply and the inflammatory process begins. The inflammatory process pulls T-lymphocytes to the skin surface. The elicitation phase is when a visible allergic reaction occurs.

The presence of the T-lymphocytes at the skin surface results in itching, redness, swelling and the development of small blisters. As the allergic reaction progresses, you may develop hives and the skin can become thick and scaly.

Severe allergic contact dermatitis can cause swelling of the mouth and throat, a condition called angioedema. During the inflammation process, your body releases chemicals called histamines, which causes your blood vessels to swell. If the blood vessels swell too much, it can interfere with breathing, possibly leading to death. If you experience swelling in the mouth after exposure to dishwashing detergent, seek emergency medical attention.

Allergic contact dermatitis is usually related to one specific chemical or a group of chemicals with similar characteristics. With dishwashing detergent, it is often added fragrances that trigger an allergic response.

To reduce the risk of allergic contact dermatitis when using dishwashing detergent, choose fragrance-free soaps. Dishwashing detergent listed as hypoallergenic and unscented may still contain small amounts of fragrance. It is also helpful to wear rubber gloves when using dishwashing detergent.

Dishwashing Detergent Contact Dermatitis on Hands

Our Technology in Dishwashing Liquid

Nano Biotech Colloidal Micelles (NBCM)

SHEPROS combines the knowledge of nanotechnology and biotechnology in using the unique colloidal chemistry to generate a state of the art formulation that produces the innovative Nano Biotech Colloidal Micelles (NBCM). NBCM are mild but are amazingly powerful colloidal micelles made from non-toxic plant based extracts, plant derivatives and biodegradable surfactants.

NBCM are very fine molecules with spherical aggregate structure which remain in suspension indefinitely and are not affected by gravity when dispersed in a liquid colloid. It is surrounded by a cloud of tightly bound ions. The NBCM aggregates form in order to minimize the free energy of the solution. They are dynamic but equilibrium structures and able to rearrange in response to changing

environmental conditions. They also undergo thermal fluctuations and Brownian motion. It works well with hard, soft, cold, hot, fresh and salt water.

Illustration of Nano Biotech Colloidal Micelles.

The hydrophobic poles attract to each other forming interior micelles cluster and the hydrophilic poles form a powerful outer surface.

NBCM in colloidal chemistry can be explained as a sub-division of physical chemistry comprising of the phenomena characteristic of matter when one or more of its dimension lie in the range between 1 nanometer and 100 nanometer. In this nature of science, the dimension of NBCM is more important than the nature of the material. In the size range of nanometer, the surface area of NBCM is much greater than its volume that unusual phenomena of colloidal micelles will occur as following:

- a. They do not settle out of the suspension of gravity.
- b. They will be small enough to pass through the unreachable exterior areas of the plants.
- c. They will move in at least one dimension randomly.
- d. They will have tremendous wetting capacity.
- e. They will reduce the surface tension in water or water solutions.
- f. They have the velocity that will move endlessly without stopping.
- g. They will have sterilizing effect by disrupting the DNA or RNA of the virus, prokaryotic cell of bacteria, and eukaryotic cell of algae, protozoa and fungi.

How do NBCM destroy bacteria?

A cell wall protects bacteria cell from the effects of osmotic pressure. NBCM destroy the peptidoglycan layer of the bacteria cell walls, but not to human beings and animals which do not have cell wall. In the absence of unstable formed peptidoglycan, growing bacteria cells will be weakened and destroy through to the following exposures:

1. Inhibition of cell wall synthesis

Generally, a bacterium is in a hypotonic solution and water tries to move in to the bacterium from a higher water concentration to the lower water concentration. When the cells are less resistant to the effect of osmotic pressure; the underlying cytoplasmic membrane bulges through the weakened portions of cell wall as water moves into the cell, and eventually the lyses.

2. Inhibition of metabolic pathways

Generally, a bacterium is in a hypotonic solution and water tries to move in to the bacterium from a higher water concentration to the lower water concentration. When the cells are less resistant to the effect of osmotic pressure; the underlying cytoplasmic membrane bulges through the weakened portions of cell wall as water moves into the cell, and eventually the lyses.

3. Inhibition of metabolic pathways

A damaged cell wall will affect all the chemical reactions in metabolism of the bacterium. The unstable metabolic pathways will result in unstable enzyme activity, temperature and pH in the cell.

3. Disruption of cytoplasmic membranes

The disruption of cytoplasmic membranes will severely damage the cytoplasm which is composed with primary 90% of water and proteins. The contents of cytoplasm such as nucleoid and ribosomes will be destroyed.

NBCM Aspects of Disinfectants in Bacteria

A scanning electron micrograph of bacteria cell before the inhibition of cell wall synthesis; inhibition of protein synthesis; and disruption of cytoplasmic membrane.

A scanning electron micrograph of bacteria cell bursts from osmotic pressure due to the integrity of peptidoglycan is not maintained. This is due to the inhibition of cell wall synthesis; inhibition of protein synthesis; and disruption of cytoplasmic membrane.

How do NBCM work in Cleaning and Degreasing?

NBCM cleaning are different from traditional cleaning technology which use the molecular attraction of cationic (positive ions) and anionic (negative ions). NBCM do not have any ionic groups and do not react with hard water ions. They have hydrophilic poles and hydrophobic poles. In a colloidal solution, if the amount of NBCM is increased, there will come to a point where they can no longer accumulate at the surface. The NBCM molecules will find other ways of shielding their hydrophobic tails from water. The NBCM molecules will aggregate into a cluster in which the tails point inwards. The head groups will form a water soluble shell in the outer surface.

When NBCM are in contact with oil (hydrocarbon) molecules, the center of NBCM bonds to a similar hydrophobic oil (hydrocarbon). They surround and separate (emulsify) oil (hydrocarbon) molecules from each other and/or the surface to which they cling. Once the oil (hydrocarbon) is surrounded and separated through the disruption in the attraction to the other oil (hydrocarbon) molecules and/or to the surface, the oil (hydrocarbon) can be uplifted from the surface and rinsed or wiped away easily.

NBCM attack the particle of grease.

Figure 2.
NBCM surround the particle of grease.

Figure 3.
NBCM break the particle of grease.

Figure 4.
The particles of grease come off to the surface & remain suspended in the water.

SHE Dishwashing Liquid

Product Description

SHE Dishwashing Liquid can serve as an excellent alternative of synthetic or phosphate based dishwashing detergents. It is specially formulated with ingredients which are non-toxic, food grade, low foaming, non-skin irritating, biodegradable and environmental friendly. It is made of powerful Nano Biotech Colloidal Micelles (NBCM) of *Nano Alpha 10* which is formulated using natural plant extracts and plant derivatives. NBCM has the power and capacity to break down almost all types of oils. It also offers disinfecting and sanitizing capabilities through NBCM's antimicrobial properties.

The formulation of SHE Dishwashing Liquid does not use the normal ingredients of synthetic dishwashing detergents such as builders, phosphate, enzyme, bleach, foaming agents, solvents, corrosion inhibitors, perfumes and colorants.

SHE Dishwashing Liquid also does not contain petroleum distillates, soaps, chemical thickening agent, nitrate, phosphate, alcohol, animal fatty acid, hydrocarbon toxic solvent, non-biodegradable surfactants and ozone depleting substances.

Application

SHE Dishwashing Liquid has strong disinfecting and degreasing capabilities. It effectively removes germs, dirt, contaminants, food particles, oils, grease and odor. This rapid rinse product cleans dishes to a sparkling shine without any residue or streaks.

Directions

Dilute 1 teaspoon (3 mL) of SHE Dishwashing Liquid to $\frac{3}{4}$ cup (150 mL) of water in a dish bowl. Wash dishes with a sponge and rinse well for sparkling and shiny result.

Acute Toxicity Test of Nano Alpha 10

Test Method: OECD Guideline for Testing of Chemicals Method 203 Fish

Result: Not hazardous to the aquatic environment.

Pusat Teknologi Alam Sekitar dan Bioproses Environment and Bioprocess Technology Centre

Bangunan 15, SIRIM Berhad, Shah Alam, Selangor Darul Ehsan.

RESULTS SUMMARY

Company Name : Shemical International Sdn Bhd

Address : Lot 109A, Jalan Gebeng 1/6,
Kaw. Perindustrian Gebeng
26080 Kuantan, Pahang
(Attn : Mr. Ng)

Request : 96-hour Fish (Tilapia), Acute Toxicity Test of Nano Alpha 10

Your Ref No.	
SIRIM Ref. No.	237/16/712
Job No.	J026/08
Report No.	R054/08
Date of Issue	17/03/08
No. of pages	11

SAMPLE DESCRIPTION

One liquid sample coded as "Nano Alpha 10" was received on 01 Feb 2008.

TEST METHOD

(1) *Fish acute toxicity test according to OECD Guidelines for Testing of Chemicals - Method 203 Fish, Acute Toxicity Test

RESULT:

Sample Code	Appearance	LC ₅₀ (96 hour) (v/v)
Nano Alpha 10	Brownish	880 mg/L (0.088%)

Note: Refer to Appendix A – R054-1/08 for details.

INFERENCE

The classification system for substances hazardous to the aquatic environment according to The Globally Harmonised System (GHS) of Classification and Labeling of Chemicals (2005) is shown below.

Toxicity Category (Acute toxicity for 96 hr LC ₅₀ for crustacea)	Classification Limit
Acute I	≤ 1 mg/l
Acute II	> 1 - ≤ 10 mg/l
Acute III	> 10 - ≤ 100 mg/l

Based on the criteria for the harmonized classification system for substances, the "Alpha Nano 10" is classified as "Not hazardous to the aquatic environment" as the LC₅₀ value is above 100 mg/l.

(The inferences expressed herein are outside the scope of accreditation)

TEST REPORT: S08CHM01431-01A-THY-CORR01
19 MAR 2008

This Report is issued under the following conditions:

1. Results of the biodegradability in the form of a report will be issued immediately after the service has been completed or terminated.
2. Unless otherwise requested, a report shall contain only technical results. Analysis and interpretation of the results and professional opinion and recommendations expressed thereupon, if required, shall be clearly indicated and additional fee paid for, by the Client.
3. This report applies to the sample of the specific production/shipment given at the time of its biodegradability. The results are not used to indicate or imply that they are applicable to other similar items. In addition, such results must not be used to indicate or imply that TÜV SÜD PSB approves, recommends or endorses the manufacture, supplier or user of such production/shipment, or that TÜV SÜD PSB in any way "guarantees" the later performance of the production/shipment.
4. The samples mentioned in this report shall be submitted/supplied/manufactured by the Client. TÜV SÜD PSB therefore assumes no responsibility for the accuracy of information on the brand name, model number, origin of manufacture, composition or any information supplied.
5. Additional copies of the report are available to the Client at an additional fee. No third party can obtain a copy of this report through TÜV SÜD PSB, unless the Client has authorized TÜV SÜD PSB in writing to do so.
6. TÜV SÜD PSB may at its sole discretion add to or amend the conditions of the report at the time of issue of the report and such report and such additions or amendments shall be binding on the Client.
7. All copyright in the report shall remain with TÜV SÜD PSB and the Client shall, upon payment of TÜV SÜD PSB's fees for the carrying out of the biodegradability, be granted a license to use or publish the report to the third parties subject to the terms and conditions herein, provided always that TÜV SÜD PSB may at its absolute discretion be entitled to impose such conditions on the licensee as it sees fit.
8. Nothing in this report shall be interpreted to mean that TÜV SÜD PSB has verified or ascertained any endorsement or marks from any other testing authority or bodies that may be found on the sample.
9. This report shall not be reproduced wholly or in parts and no reference shall be made by the Client to TÜV SÜD PSB or to the report or results furnished by TÜV SÜD PSB in any advertisement or sales promotion.
10. Unless otherwise stated, the tests are carried out in TÜV SÜD PSB Pte Ltd, No. 1 Science Park Drive Singapore 118221.
